# ECB workshop on the Future of B2B Payments

Nick Kerigan Head of Innovation October 2024

Confidentiality: Public

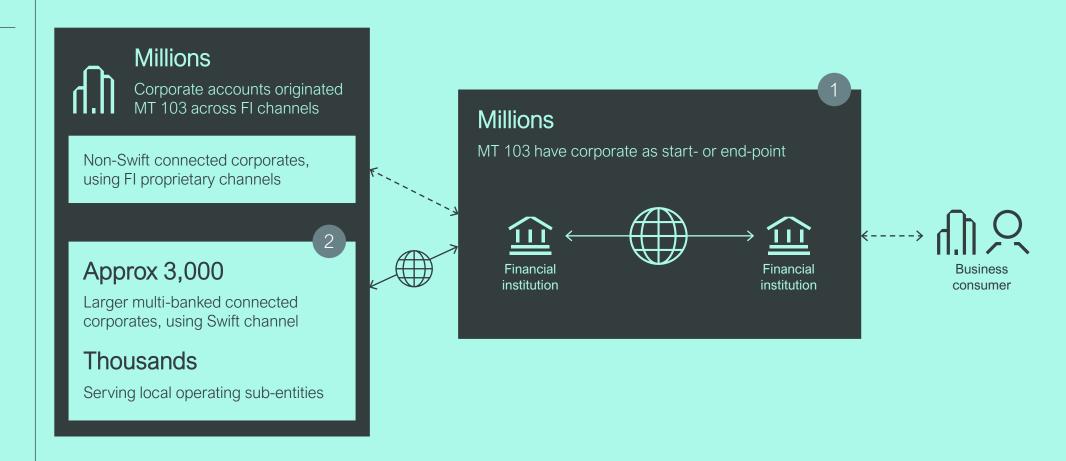

# Context: B2B payments today

October 2024
Future of B2B
Payments

#### Swift currently serves corporates' needs for B2B payments

October 2024
Future of B2B
Payments

#### Three reasons to focus on corporates

October 2024 Future of B2B Payments Swift's strategy is to drive instant and frictionless transaction experience end-to-end.

Supporting corporate business of financial institutions (FIs) is core element.

For **both** connected and non-connected corporates.

Enable rich data via ISO 20022

Achieve overall uplift in experience

Fls are asking for help

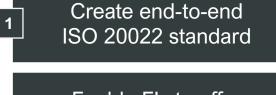

#### How to achieve this: implementation rests on three key pillars

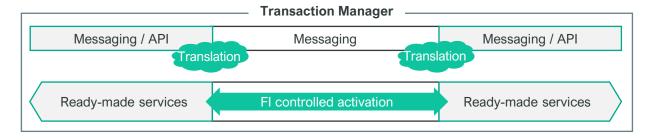

October 2024
Future of B2B
Payments

Enable Fls to offer ready-made services

Explore options for nonconnected and add value

- High data quality at payment acquisition and reconciliation
- Fls deploy and control Swift experience
- Additional transaction and connectivity services
- Work with key vendors and ERP providers to embed standards
- Further explore, e.g. identity services for non-connected corporates, services that help end-to-end flow with community benefit
- Approach is extendable to other client segments, complementary to digitisation in Trade and leveraging APIs

# Insights for the Future: from our recent Phase 2 sandbox

October 2024
Future of B2B
Payments

# The latest Swift Phase 2 sandbox initiative, published in March 2024, was one of the largest global CBDC collaborations ever, encompassing 38 institutions from across the world

#### Sandbox participants, as disclosed:

October 2024
Future of B2B
Payments

Central banks	Commercial banks
Australia	ANZ
Czechia	Citibank
France	DBS Bank Limited
Germany	Deutsche Bank
Singapore	HSBC
Taiwan	Hua Nan Commercial Bank, Ltd.
Thailand	Intesa Sanpaolo
	NatWest Group
	Santander Bank
	Société Générale
	Standard Chartered
	Sumitomo Mitsui Banking Corporation
	The Shanghai Commercial & Savings Bank (Taiwan)
	The Standard Bank of South Africa
	United Overseas Bank
	Westpac Banking Corporation

#### Financial market infrastructures

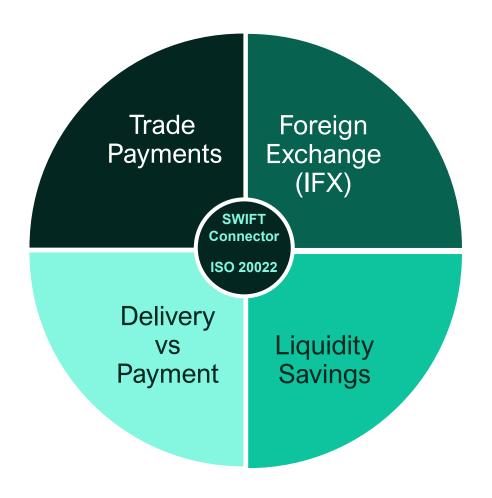

CLS Group

DTCC

### The Phase 2 sandbox to explored more complex and market-relevant use cases, using the experimental Swift interlinking solution

October 2024 Future of B2B Payments

The **Use Cases** were defined and prioritized by the sandbox participants

The **Project** was divided into two streams of work, 'talk' and 'walk':

- Collaborative working group sessions business and technical focus
- 2. Hands on exploration in a sandbox environment

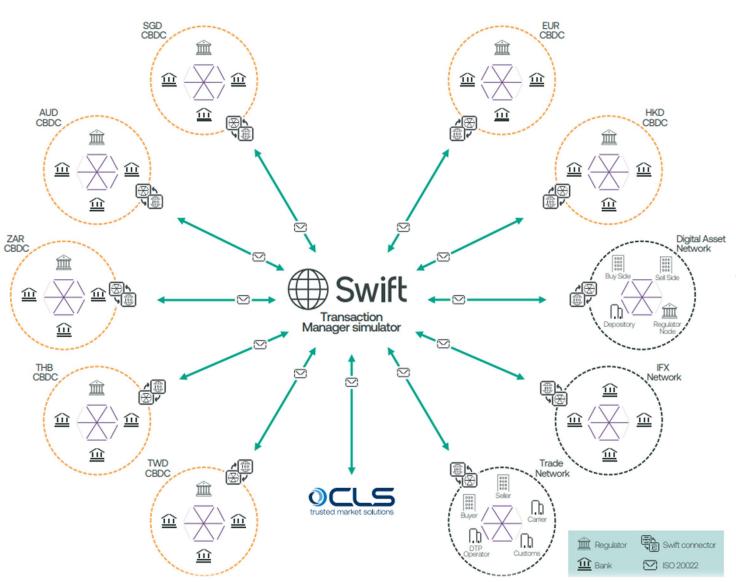

**The Activities** were intense over 6 months:

- Ran 20 working group sessions with an average of 60 participants in each session.
- Onboarded 125 users from 38 organisations involved for a period of four months

#### The Phase 2 sandbox was set up to simulate multiple currencies and use cases

October 2024 Future of B2B Payments

**7** simulated CBDC networks

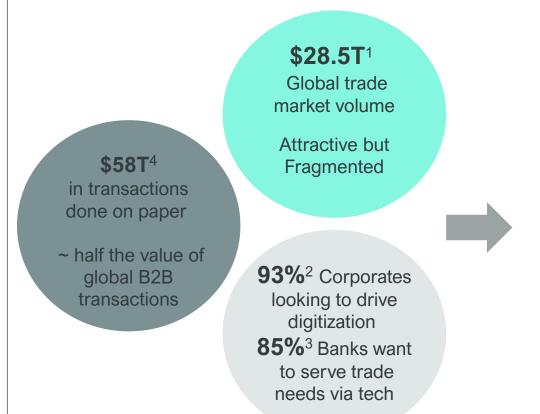

**3** digital networks – Digital Trade Network, Assets, IFX Network,

1 existing market infrastructure

#### Why Trade? Strong economic potential to digitise global trade

October 2024
Future of B2B
Payments

**Digitization** will help in:

- USD 6 billion reduction in trade cost\*.
- 10% boost in trade revenues generating a 40% increase in global trade\*\*.

Increased need for **data and transparency** as a license to operate.

**Resilience and interoperability** being the key requirements for efficient collaboration in cross border trade.

Expectation is to orchestrate the ecosystem from a standards, rules, and exchange of information perspective.

#### Trade Payments use case built on insights gained in first eBL PoC

Enabling interoperability between financial institutions and electronic Bill of Lading (eBL) platforms

October 2024
Future of B2B
Payments

Successfully conducted the eBL POC with 4 platforms and 2 banks (DB and BNY) for an entire eBL lifecycle.

The goal was to validate feasibility to exchange electronic bills of lading and achieve seamless interoperability and integration across banks and trade platforms - thereby eliminating the need for peer-to-peer integration between different participants.

By establishing the technological foundation for interoperability, our solution using a standardized API has the potential to reduce costs and improve efficiency.

Swift to support onboarding of eBL platforms as next step.

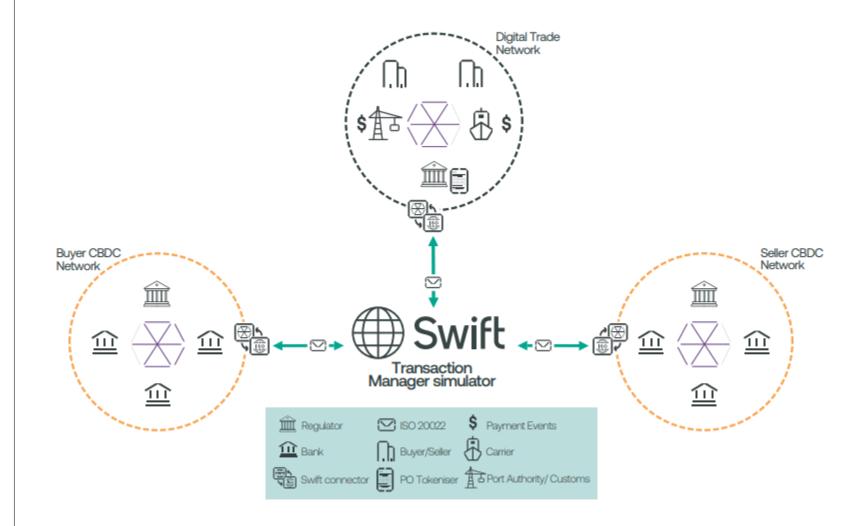

Swift as a founding member of FIT Alliance is working on raising awareness around adoption of eBLs.

October 2024 Future of B2B Payments

# In the Trade Payments use case we simulated a Digital Trade Platform (DTP) that could digitize and tokenise Purchase Orders (PO)

This enabled trade events to automatically trigger payments on the digital currency networks (TvP)

#### October 2024 Future of B2B Payments

#### Trade Payments use case generated seven key outcomes

#### 1. Trade lifecycle

The DTP comprised the buyer, seller, carrier, port authority and their respective banks. Through the 'open account' approach, we were able to represent most of the actors present in a trade lifecycle.

#### 2. Smart contracts

The DLT-based DTP allowed us to implement effective smart contracts for capturing trade clauses in a typical trade contract

#### 3. Payment workflows

Event-driven programming implemented on the digital trade network allowed us to automate pre-approved payment workflows between two networks using the Swift Transaction Manager simulator. For payments processed outside operating hours, this meant that the need for manual intervention was reduced. Payment events were programmed based on documentary evidence, such as customs certificates.

#### 4. Fraud risk

We found that tokenising a PO, and managing the lifecycle of a PO token and associated payment events via smart contracts, can reduce can reduce fraud and double financing issues. This is made possible because the PO token is escrowed until a pending invoice is settled.

#### 5. Intermediaries

The experiment showed that interlinking multiple digital networks and streamlining payments can help reduce the number of intermediaries needed in cross-border trade payments. Peer-to-peer atomic trade-versus-payment was possible.

#### 6. Trade digitisation

The continued use of ISO messaging standards will help with trade digitisation and bring in a common interoperability layer.

#### 7. Interoperability

Ultimately, the experiment demonstrated seamless interoperability between different digital networks across technology stacks using the Swift connector.

#### Trade Payments could significantly benefit from digitisation and tokenisation

October 2024
Future of B2B
Payments

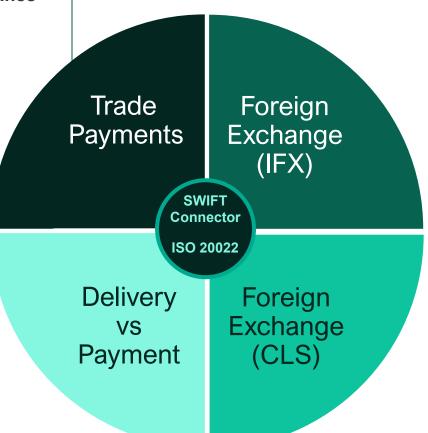

to improve efficiency, reduce costs & fraud.

Participants also highlighted the potential of this solution to reduce trade payment delays and enhance trust among trade parties.

Digitisation and tokenisation of Trade has clear potential

Orchestration & straight-through processing

of trigger-based payments across trade platforms, banks and wider trade ecosystem is possible

#### Considerations for digital euro or wholesale central bank money settlement (ntwCeBM)

October 2024
Future of B2B
Payments

#### 1. Programmability and ability to trigger and orchestrate transactions is a requirement

Delivery of efficiency benefits in Trade and other use cases depends on these capabilities

#### 2. Payment platforms need to include escrow or earmarking functionalities

TVP, DvP and PvP transactions all rely on an 'escrow and release' type of functionality. This could be delivered using either DLT or non-DLT technology

#### 3. Interoperability is key

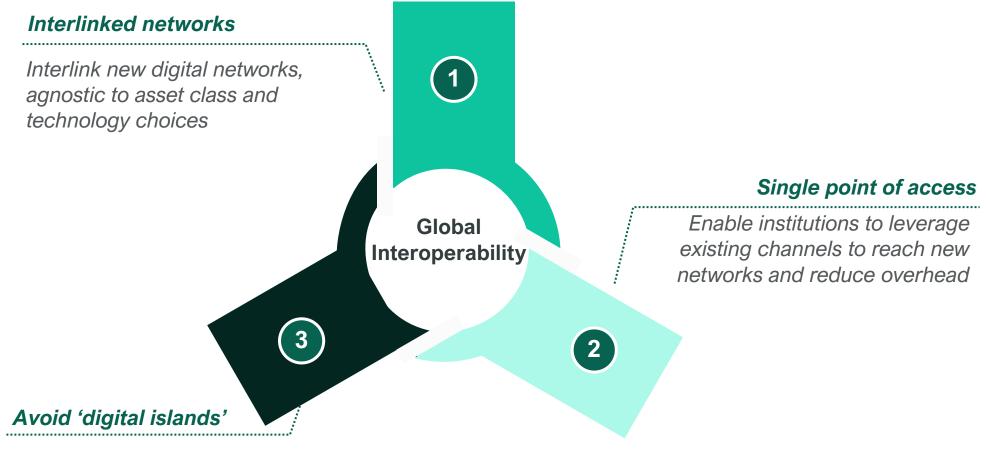

Payments are usually 'for' something, so new payment platforms need to be able to link with trade, securities, existing payment platforms...

**Interoperability is hard – but necessary.** There is no single model, but these initiatives gives us confidence that emerging networks can be supported through a standardised approach

#### **Guiding Principles for interoperability**

October 2024 Future of B2B Payments

Ensure new digital networks can not only connect to each other, but to the existing financial system (e.g. using a common language such as ISO 20022)

#### How we are moving forward

October 2024
Future of B2B
Payments

#### 1. Enhancing the Swift experimental interlinking solution (Innovation-led)

Support continued market experimentation by enhancing the Swift connector to support additional Payment-versus-Payment (PvP) and DvP use cases, while adding functional enhancements and new technical capabilities

#### 2. Developing real-world solutions for digital assets (Product-led)

Support for testing of live movements of assets and value - as announced in our <u>recent article</u>. Aim to be available for DvP and PvP use cases by 2025

#### 3. Demonstrating how we could interlink other networks (Innovation-led)

For example, as bank-led tokenised deposit networks. Together with supporting community efforts to further innovate in this area, both by participating in industry initiatives and by contributing to network capabilities
